

- Gonzalo Oviedo Lambert
- *Senior Software Engineer — AI Training Data & Reinforcement Learning Environments*
- Limache, Valparaíso Region, Chile | GMT-4 - UTC-4
- goviedo.laboral@gmail.com | +56 9 6372 3603
- [linkedin.com/in/gol](https://www.linkedin.com/in/gol) | English B2

Professional Summary

Senior Software Engineer with 15+ years building critical, production-grade systems, primarily in **Java (Spring Boot)**, with working proficiency in **TypeScript/JavaScript (Node.js)** and hands-on exposure to **Python**. Deep, everyday expertise in **algorithms, data structures, debugging, and root-cause analysis** across unfamiliar codebases in banking, e-commerce, healthcare, and EdTech domains.

Since 2024, works daily inside **Claude Code (Max plan, heavy daily use)** as primary engineering environment — Anthropic's own agentic coding harness — complemented by earlier experience with Pi.dev and opencode. This means writing precise specifications, designing agent lifecycles, and rigorously verifying AI-generated code against production standards, all inside the same harness family this role is meant to train and evaluate. That gives direct, practical fluency in exactly the skill this role requires: turning a real-world software problem into a **reproducible environment plus a clean, correct, well-reasoned golden reference solution** that can reliably train and evaluate a coding model.

Comfortable reviewing peer-contributed code for correctness and clarity, documenting the *why* behind technical decisions, and picking up unfamiliar stacks quickly — all core habits from 15 years of cross-team, cross-language, multicultural engineering work.

Why This Role Fits

- **Builds golden references for a living.** Day-to-day work already means writing the *correct, idiomatic* implementation of a feature or fix, then verifying an AI agent's output against it line by line — the exact loop an RL environment needs (task → reproducible setup → reference solution → verification).
- **Debugging and root-cause analysis** is a core skill from 15 years across legacy and modern codebases — Sybase-to-Oracle migrations, AS/400-to-Java rewrites, and production incident response in banking and healthcare systems.
- **Algorithms & data structures** applied daily in real backend systems: query optimization (Oracle/PostgreSQL), data modeling, and performance-critical service design.
- **Clean, documented, reviewable code** is a personal standard, not a checklist — reflected in consistent code review practices and mentoring of junior developers.
- **Cross-language adaptability:** primary depth in Java, working fluency in JavaScript/TypeScript and Node.js, and direct current experience navigating Python codebases through AI-assisted tooling.
- **AI-native workflow:** already spends the majority of the working day inside Claude Code (Max plan) directing, reviewing, and correcting AI coding agents — meaning the reasoning and documentation habits this role needs are already second nature, not a new skill to learn.

Technical Skills

- **Primary Language:** Java (1.8 – 21), Spring Boot — 12+ years production experience
- **Secondary Languages:** JavaScript (ES6+) / TypeScript, Node.js
- **Working Exposure:** Python (scripting, tooling, AI-assisted development)
- **Algorithms & Data Structures:** query/data-structure optimization, performance tuning, complexity analysis in production systems

- **Databases:** PostgreSQL, Oracle PL/SQL, MySQL, MongoDB — schema design, migrations, query optimization
- **AI & Agent Harnesses:** Claude Code (Max plan) — primary daily coding environment; also Pi.dev, opencode; agent lifecycle design (skills, commands, workflows); prompt/context engineering; human-in-the-loop verification of AI-generated code
- **Cloud & DevOps:** Google Cloud Platform (Pulumi IaC), Docker, AWS (Lambda), Jenkins, GitLab CI, Azure DevOps
- **Practices:** Agile (Scrum, Kanban), code review, root-cause debugging, technical documentation, reproducible environments

Relevant Experience

Tech Lead & Lead Software Engineer | *Mobility Startup* 2024 — Present **Technologies:** Java 21 (Spring Boot), Flutter, Elixir, Google Cloud, Pulumi IaC, Claude Code (Max plan), Pi.dev, opencode

- Works daily as the human verifier in an AI-agent development loop inside Claude Code (Max plan): specifies the task, lets the agent attempt a solution, and produces or corrects the reference implementation — the same task/solution/verification pattern used to build RL training environments.
- Designed the agent lifecycle (skills, commands, workflows) inside custom harness execution environments, documenting reasoning and constraints so outputs stay correct and reproducible.
- Maintains a clean, highly documented codebase, translating business rules into precise, testable specifications.
- Built automated GCP infrastructure via Pulumi for reproducible, versioned environments.

Java Associate Developer | *Perficient — Caterpillar* 2022 — 2023 **Technologies:** Java 21 (Spring Boot), React, microservices, Docker, Jenkins

- Debugged and resolved defects across a global e-commerce microservices platform, documenting root cause and fix rationale for distributed teams (U.S., India, Latin America).
- Built and reviewed small-to-medium features under CI/CD, keeping solutions minimal, readable, and well-tested.

Java Specialist | *Citibank* 2021 — 2022 **Technologies:** Java, Spring Beans, Oracle SQL, Jenkins, Git

- Led the Sybase-to-Oracle database migration: identified logic and data-integrity bugs across the codebase, fixed them cleanly, and documented the reasoning for a multicultural team (U.S., Ukraine, India, Chile) to review.
- Wrote and maintained internal reports and utilities under strict correctness and audit requirements.

Tech Lead & Software Architect | *Seven IT SpA (Cruz del Norte Hospital, SQM)* 2017 — 2020 **Technologies:** Spring Boot (REST, MVC), PostgreSQL, Google Cloud, JavaScript, Vue.js

- Owned architecture and code review for a healthcare records system, where a single logic bug carried real clinical risk — enforced rigorous review and test discipline across a 4-developer team.
- Built data-verification routines specifically to catch edge cases before they reached production.

Java/Senior Developer | *WebClass, Creasys, Coopeuch, Others* 2008 — 2017 **Technologies:** Java, Struts, Hibernate, PostgreSQL, Oracle, Jenkins, Git

- Full-cycle developer across banking, EdTech, and enterprise systems: requirements analysis, implementation, debugging, and QA.
- Managed legacy-to-modern migrations (AS/400 to Java), a direct exercise in reading unfamiliar code and rebuilding it correctly.

Education

Computer Science Execution Engineering | Universidad del Bío Bío, 1998 — 2005 Thesis: Extreme Programming (XP) — Theory and practice.
